

# SGLang Evolution Brief

Official-release evolution through 2026-09-05 · latest stable: v0.5.19

## One-line conclusion

SGLang evolved through release-documented engine, scheduling, model-support, and distributed-serving changes. This brief only summarizes official-source evidence.

## Release evolution timeline

| Stage                            | Representative releases | Architectural transition    |
|----------------------------------|-------------------------|-----------------------------|
| Runtime foundation               | v0.1.5 – v0.1.20        | OpenAI-compatible serving   |
| High-performance engine          | v0.2.0 – v0.3.6         | Chunked Prefill             |
| DeepSeek and distributed serving | v0.4.0 – v0.4.10        | DeepSeek V3/R1 optimization |
| Platform and hybrid models       | v0.5.1 – v0.5.9         | HiCache                     |
| Production architectures         | v0.5.10 – v0.5.19       | Elastic EP                  |

## Engine path · scale path · model path

Engine: release-documented execution, compilation, and kernel changes. Scale: release-documented parallelism and disaggregation changes. Models: release-documented dense, MoE, multimodal, speech, and hybrid-model support. Consult configured official documentation for current architecture details.

## Key version milestones

| Date       | Release | Official source                                                                                                                     |

## Deployment takeaways

Why SGLang: release-documented serving and scaling evolution. What to manage: version cadence, model/hardware compatibility, cache and parallel settings, and migration notes for defaults/deprecations.

Sources: official GitHub Releases and configured official documentation. Cutoff 2026-09-05; source mode live.
